

## SAVEETHA SCHOOL OF ENGINEERING

### SAVEETHA INSTITUTE OF MEDICAL AND TECHNICAL SCIENCES

#### ITA 0443 - STATISTICS WITH R PROGRAMMING FOR REAL TIME PROBLEM

#### DAY 2 – LAB EXERCISES

**Reg No: 191911211**

**Name: K.Abhishek**

### 1.IMPLEMENTATION OF VECTOR RECYCLING, APPLY FAMILY & RECURSION

The screenshot shows an RStudio session with a script editor on the left and an output console on the right. The script contains three lines of R code: `vec1=1:6`, `vec2=1:2`, and `print(vec1-vec2)`. The output console shows the result of the subtraction: `[1] 2 4 4 6 6 8`. The interface includes a toolbar with icons for file operations, a 'Run' button, and a 'Clear' button for the output.

```
main.r  
1 vec1=1:6  
2 vec2=1:2  
3 print(vec1-vec2)  
  
Output  
Rscript /tmp/j3TheAQcjU8.r  
[1] 2 4 4 6 6 8
```

### 2. Demonstrate the usage of apply function in R

The screenshot shows an RStudio session with a script editor on the left and an output console on the right. The script contains four lines of R code: `m1 <- matrix(C=(1:10),nrow=5, ncol=6)`, `m1`, `a_m1 <- apply(m1, 2, sum)`, and `a_m1`. The output console shows the result of the `apply` function: a matrix with 5 rows and 6 columns, where each column contains the sum of the elements in that column of the original matrix. The output is displayed as a matrix with row indices [1,] through [5,] and column indices [1,] through [6,]. The interface includes a toolbar with icons for file operations, a 'Run' button, and a 'Clear' button for the output.

```
main.r  
1 m1 <- matrix(C=(1:10),nrow=5, ncol=6)  
2 m1  
3 a_m1 <- apply(m1, 2, sum)  
4 a_m1  
  
Output  
Rscript /tmp/j3TheAQcjU8.r  
[1,] [2,] [3,] [4,] [5,] [6,]  
[1,] 1 6 1 6 1 6  
[2,] 2 7 2 7 2 7  
[3,] 3 8 3 8 3 8  
[4,] 4 9 4 9 4 9  
[5,] 5 10 5 10 5 10  
[1] 15 40 15 40 15 40
```

### 3. Demonstrate the usage of l apply function in R

```
main.r  Run  Output
1 movies <- c("SPYDERMAN","BATMAN","VERTIGO","CHINATOWN")
2 movies_lower <- lapply(movies, tolower)
3 str(movies_lower)
```

```
Rscript /tmp/jTheAQcju8.r
List of 4
 $ :chr "spyderman"
 $ :chr "batman"
 $ :chr "vertigo"
 $ :chr "chintown"
```

### 4. Demonstrate the usage of s apply function in R

```
main.r  Run  Output
1 dt <- cars
2 lmn_cars <- lapply(dt, min)
3 smn_cars <- sapply(dt, min)
4 lmn_cars
```

```
Rscript /tmp/jTheAQcju8.r
$speed
[1] 4

$dists
[1] 2
```

### 5. Demonstrate the usage of t apply function in R

```
main.r  Run  Output
1 data(iris)
2 tapply(iris$Sepal.Width, iris$Species, median)
3
```

```
Rscript /tmp/jTheAQcju8.r
setosa versicolor virginica
 3.4      2.8      3.0
```

## 6. Demonstrate the usage of m apply function in R

The screenshot shows the RStudio editor with a script named 'main.r'. The code defines three vectors: `vec1` (1, 2, 3, 4), `vec2` (2, 4, 6, 8), and `vec3` (3, 6, 9, 12). The `mapply` function is used to calculate the product of these vectors element-wise. The output window shows the result: `[1] 6 48 162 384`.

```
main.r
1 vec1 <- c(1, 2, 3, 4)
2 vec2 <- c(2, 4, 6, 8)
3 vec3 <- c(3, 6, 9, 12)
4 mapply(function(val1, val2, val3) val1*val2*val3, vec1, vec2, vec3)
5
6
```

Output

```
Rscript /tmp/jTHeAQCju8.r
[1] 6 48 162 384
```

## 7. Sum of Natural Numbers using Recursion

The screenshot shows the RStudio editor with a script named 'main.r'. A recursive function `sum` is defined to calculate the sum of natural numbers up to `n`. The function uses a base case of `n <= 1` and a recursive case of `return(n + sum(n-1))`. The function is called with `sum(7)`. The output window shows the result: `[1] 28`.

```
main.r
1 sum<-function(n){
2   if (n<=1){
3     return(n)
4   }else{
5     return(n+sum(n-1))
6   }
7 }
8 sum(7)
```

Output

```
Rscript /tmp/N2hvIrq8rf.r
[1] 28
```

Establishing secure connection...

## 8. Write a program to generate Fibonacci sequence using Recursion in R

The screenshot shows an RStudio window with a script editor on the left and an output console on the right. The script editor contains the following R code:

```
1  
2 fibonacci <- function(n) {  
3   if (n == 0) {  
4     return(0)  
5   } else if (n == 1) {  
6     return(1)  
7   } else {  
8     return(fibonacci(n-1) + fibonacci(n-2))  
9   }  
10 }  
11  
12 # Test the function by generating the first 10 numbers in the sequence  
13 for (i in 0:9) {  
14   print(fibonacci(i))  
15 }  
16
```

The output console shows the results of the function calls:

```
Rscript /tmp/N2hvIrg8rf.r  
[1] 0  
[1] 1  
[1] 1  
[1] 2  
[1] 3  
[1] 5  
[1] 8  
[1] 13  
[1] 21  
[1] 34
```

## 9. Write a program to find factorial of a number in R using recursion.

The screenshot shows an RStudio window with a script editor on the left and an output console on the right. The script editor contains the following R code:

```
1  
2 factorial <- function(n) {  
3   if (n == 0) {  
4     return(1)  
5   } else {  
6     return(n * factorial(n - 1))  
7   }  
8 }  
9 n <- 7  
10 result <- factorial(n)  
11 cat("The factorial of", n, "is", result)  
12
```

The output console shows the result of the function call:

```
Rscript /tmp/N2hvIrg8rf.r  
The factorial of 7 is 5040
```

## CREATION AND MANIPULATION OF DATAFRAMES IN R

### Exercise 1

Consider two vectors: `x=seq(1,43,along.with=Id)`

`y=seq(-20,0,along.with=Id)`

Create a data frame 'df' as shown below.

```
>df
```

```
Id Letter x y
```

```
1 1 a 1.000000 -20.000000
```

```
2 1 b 4.818182 -18.181818
```

```
3 1 c 8.636364 -16.363636
```

```
4 2 a 12.454545 -14.545455
```

```

5 2 b 16.272727 -12.727273
6 2 c 20.090909 -10.909091
7 3 a 23.909091 -9.090909
8 3 b 27.727273 -7.272727
9 3 c 31.545455 -5.454545
10 4 a 35.363636 -3.636364
11 4 b 39.181818 -1.818182
12 4 c 43.000000 0.000000

```

The screenshot shows the Programiz R Online Compiler interface. The editor on the left contains the following R code:

```

1 Id <- rep(1:4, each = 3)
2 x=seq(1,43,along.with=Id)
3 y=seq(-20,0,along.with=Id)
4 Letter=rep(letters[1:3],4)
5
6
7 df <- data.frame(Id,Letter,x,y)
8 df

```

The output window on the right displays the result of running the code:

```

Rscript /tmp/NzhvIrg8rf.r
Id Letter      x      y
1 1      a  1.000000 -20.000000
2 2      b  4.818182 -18.181818
3 1      c  8.636364 -16.363636
4 2      a 12.454545 -14.545455
5 2      b 16.272727 -12.727273
6 2      c 20.090909 -10.909091
7 3      a 23.909091  -9.090909
8 3      b 27.727273  -7.272727
9 3      c 31.545455  -5.454545
10 4      a 35.363636  -3.636364
11 4      b 39.181818  -1.818182
12 4      c 43.000000   0.000000

```

## Exercise 2

Using the data frame 'df' in Exercise1, Construct the following data frame.

```

Id x.ay.ax.by.bx.cy.c 1 1 1.000000 -20.000000 4.818182 -18.181818
8.636364 -16.363636 4 2 12.45455 -14.545455 16.272727 -12.727273
20.090909 -10.909091 7 3 23.90909 -9.090909 27.727273 -7.272727
31.545455 -5.454545 10 4 35.36364 -3.636364 39.181818 -1.818182
43.000000 0.000000

```

## Exercise 3

Create two data frame df1 and df2:

```
> df1
```

Id Age

```
1 1 14
```

```
2 2 12
```

```
3 3 15
```

```
4 4 10
```

```
> df2
```

Id Sex Code

```
1 1 F a
2 2 M b
3 3 M c
4 4 F d
```

From df1 and df2 create M:

```
>M
Id Age Sex Code
1 1 14 F a
2 2 12 M b
3 3 15 M c 4 4 10 F d
```

#### **Exercise 4**

Create a data frame df3:

```
> df3 id2
score 1 4
100
2 3 98
3 2 94
4 1 99
```

From M (used in Exercise-3) and df3 create N:

```
Id Age Sex Code score
1 1 14 F a 99
2 2 12 M b 94
3 3 15 M c 98 4 4 10 F d 100
```

#### **Exercise 5**

Consider the previous one data frame N:

- 1) Remove the variables Sex and Code
- 2) From N, create a data frame:

values ind

```
1 1 Id
2 2 Id
3 3 Id
4 4 Id
5 14 Age
6 12 Age
```

7 15 Age  
8 10 Age  
9 99 score  
10 94 score  
11 98 score  
12 100 score

### Exercise 6

For this exercise, we'll use the (built-in) dataset trees.

- a) Make sure the object is a data frame, if not change it to a data frame.
- b) Create a new data frame A:

```
>A
Girth Height Volume
mean_tree 13.24839 76 30.17097
min_tree 8.30000 63 10.20000
max_tree 20.60000 87 77.00000
sum_tree 410.70000 2356 935.30000
```

### Exercise 7

Consider the data frame A:

- 1) Order the entire data frame by the first column.
- 2) Rename the row names as follows: mean, min, max, tree

### Exercise 8

Create an empty data frame with column types:

```
>df
IntsLogicals Doubles Characters
(or 0-length row.names)
```

### Exercise 9

Create a data frame XY

```
X=c(1,2,3,1,4,5,2)
Y=c(0,3,2,0,5,9,3)
> XY
X Y
1 1 0
2 2 3
3 3 2
4 1 0
5 4 5
```

6 5 9

7 2 3

- 1) look at duplicated elements using a provided R function.
- 2) keep only the unique lines on XY using a provided R function.

### Exercise 10

Use the (built-in) dataset Titanic.

- a) Make sure the object is a data frame, if not change it to a data frame.
- b) Define a data frame with value 1st in Class variable, and value NO in Survived variable and variables Sex, Age and Freq.

```
Sex Age Freq
1 Male Child 0
5 Female Child 0
9 Male Adult 118
13 Female Adult 4
```

## MERGING DATAFRAMES

### Exercise 11 a)

Create the following dataframes to merge:

```
buildings<- data.frame(location=c(1, 2, 3), name=c("building1", "building2", "building3"))
data <-
data.frame(survey=c(1,1,1,2,2,2),location=c(1,2,3,2,3,1),efficiency=c(51,64,70,7,80,58))
```

The dataframes, *buildings* and *data* have a common key variable called, “location”.

Use the merge() function to merge the two dataframes by “location”, into a new dataframe, “buildingStats”.

### Exercise 11 b)

Give the dataframes different key variable names:

```
buildings<- data.frame(location=c(1, 2, 3), name=c("building1", "building2", "building3"))
data <- data.frame(survey=c(1,1,1,2,2,2), LocationID=c(1,2,3,2,3,1),
efficiency=c(51,64,70,71,80,58))
```

The dataframes, buildings and data have corresponding variables called, location, and LocationID. Use the merge() function to merge the columns of the two dataframes by the corresponding variables.

## DIFFERENT TYPES OF MERGE IN R

### **Exercise 12a)InnerJoin:**

The R merge() function automatically joins the frames by common variable names. In that case, demonstrate how you would perform the merge in **Exercise 11a** without specifying the key variable.

### **Exercise 12b)OuterJoin:**

Merge the two dataframes from **Exercise 11a**. Use the “all=” parameter in the merge() function to return all records from both tables. Also, merge with the key variable, “location”.

### **Exercise 12c)Left Join:**

Merge the two dataframes from **Exercise 11a**, and return all rows from the left table. Specify the matching key from **Exercise 11a**.

### **Exercise 12d)Right Join:**

Merge the two dataframes from **Exercise 11a**, and return all rows from the right table. Use the matching key from **Exercise 11a** to return matching rows from the left table.

### **Exercise 12e)Cross Join:**

Merge the two dataframes from **Exercise 11a**, into a “Cross Join” with each row of “buildings” matched to each row of “data”. What new column names are created in “buildingStats”?

### **Exercise 13MergingDataframe rows:**

To join two data frames (datasets) vertically, use the rbind function. The two data frames must have the same variables, but they do not have to be in the same order.

Merge the rows of the following two dataframes:

```
buildings<- data.frame(location=c(1, 2, 3), name=c("building1",  
"building2", "building3"))  
buildings2 <- data.frame(location=c(5, 4, 6), name=c("building5", "building4", "building6"))
```

Also, specify the new dataframe as, “allBuidings”.

### Exercise 14

Create a new dataframe, buildings3, that has variables not found in the previous dataframes.

```
buildings3 <- data.frame(location=c(7, 8, 9), name=c("building7", "building8", "building9"),
startEfficiency=c(75,87,91))
```

Create a new buildings3 without the extra variables.

### Exercise 15

Instead of deleting the extra variables from buildings3, append the buildings, and buildings2 with the new variable in buildings3, (from Exercise 14). Set the new data in buildings and buildings2, (from Exercise 13), to NA.

## RESHAPE FUNCTION IN R

### Exercise: 16

Construct the following data frame 'country'.

	countries	value.population_in_million	value.gdp_percapita
1	A	100	2000
2	B	200	7000
3	C	120	15000

#### a) Reshape in R from wide to long:

Reshape the above data frame from wide to long format in R.

countries	population_in_million	gdp_percapita	TO	countries	time	value
A	100	2000		A	population_in_million	100
B	200	7000		B	population_in_million	200
C	120	15000		C	population_in_million	120
				A	gdp_percapita	2000
				B	gdp_percapita	7000
				C	gdp_percapita	15000

Diagram illustrating the reshape process from wide to long format:

- The initial wide format table (left) has columns: countries, population\_in\_million, gdp\_percapita.
- A horizontal double-headed arrow labeled "wide" spans the first two columns of the wide table.
- The word "TO" is in a green box.
- A vertical double-headed arrow labeled "Long" spans the rows of the long table.
- The resulting long format table (right) has columns: countries, time, value.

- data frame “country” is passed to reshape function
- idvar is the variable which need to be left unaltered which is “countries”
- varying are the ones that needs to converted from wide to long
- v.names are the values that should be against the times in the resultant [data frame](#).
- new.row.names is used to assign row names to the resultant dataset
- direction is, to which format the data needs to be transformed

### b) Reshape in R from long to wide:

																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																					</

- data (country\_w\_to\_L) which is in long format, is passed to reshape function
- idvar is the variable which need to be left unaltered, which is “countries”
- timevar are the variables that needs to converted to wide format
- v.names are the value variable
- direction is, to which format the data needs to be transformed

## 7. MELTING AND CASTING IN R

### Exercises 17 :

1. Melt airquality data set and display as a long – format data ?
2. Melt airquality data and specify month and day to be “ID variables” ?
3. Cast the molten airquality data set .
4. Use cast function appropriately and compute the average of Ozone, Solar.R , Wind and temperature per month ?

## 8 FILE MANUPULATION IN R

### Exercise 18

1. Consider the following data present. Create this file using windows notepad . Save the file as **input.csv** using the save As All files(\*.\*) option in notepad.

```
id,name,salary,start_date,dept
1,Rick,623.3,2012-01-01,IT
2,Dan,515.2,2013-09-23,Operations
3,Michelle,611,2014-11-15,IT
4,Ryan,729,2014-05-11,HR
5,Gary,843.25,2015-03-27,Finance
6,Nina,578,2013-05-21,IT
7,Simon,632.8,2013-07-30,Operations
8,Guru,722.5,2014-06-17,Finance
```

2. Use appropriate R commands to read **input.csv** file.
3. Analyze the CSV File and compute the following.
  - a. Get the maximum salary
  - b. Get the details of the person with max salary
  - c. Get all the people working in IT department
  - d. Get the persons in IT department whose salary is greater than 600
  - e. Get the people who joined on or after 2014
4. Get the people who joined on or after 2014 and write the output onto a file called output.csv
